

PARTS OF AN INSECT

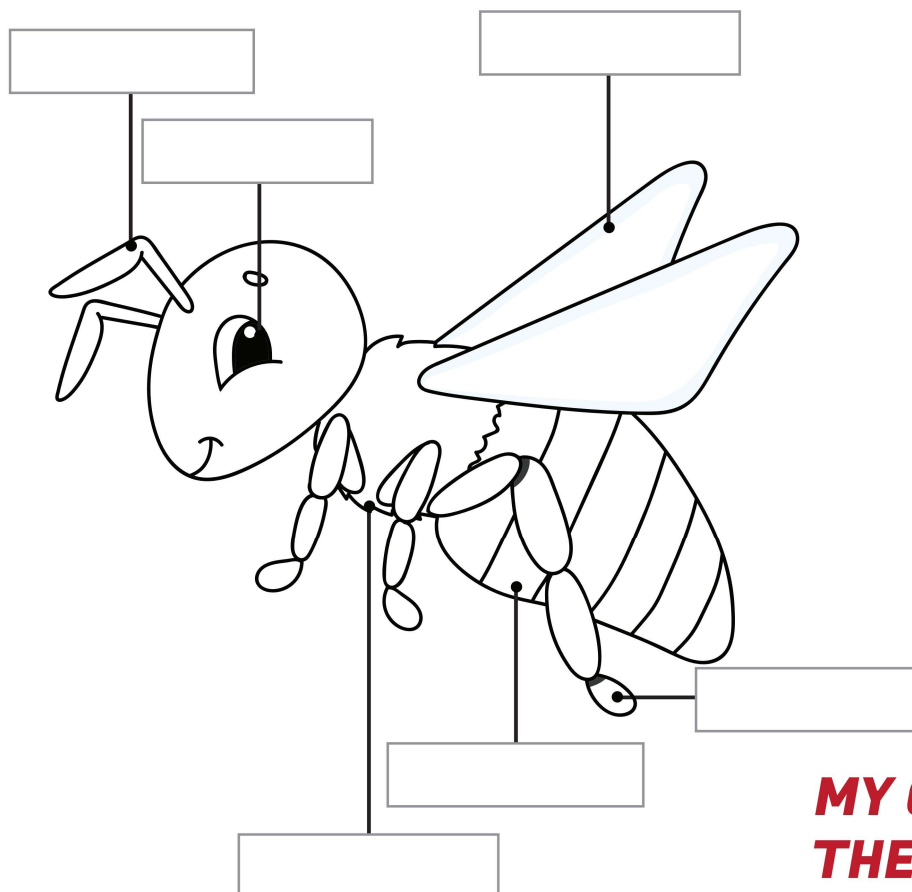

There are different kinds of insects in the world. All insects have six legs and three body parts – the head, thorax and the abdomen.

All insects have two antennae. These are used to feel, smell and taste.

Some insects have wings and so can fly. Others do not have wings and so they crawl, jump or swim.

Insects weave web, build hive, and also dig holes in the soil to live. They can also be seen on plants and grass.

Colour the Insect and Label its parts. Take help from the word box.

HEAD
